AMOSTRAS (1,3,4)
Amostras

- Soro não hemolisado de doente em jejum.
- Plasma colhido em heparina de lítio não hemolisado de doente em jejum.
- Urina a acidificar (pH < 3) após colheita e depois de diluir a 1/10 com a solução salina NaCl 9 g/L antes da análise (na ausência de pré-diluição pelo automóto). Para utilizadores do Selectra TouchPro, pré-diluição é realizada automaticamente. Os resultados são tomados em consideração na diluição. Os resultados são tomados em consideração na diluição.
- Não utilizar outras amostras.

Aviso e precauções

- De acordo com as boas práticas de laboratório, a amostragem deve ser executada antes da administração de drogas.
- Separe rapidamente os eritrócitos após a coleta.
- Não utilizar amostras visivelmente turvas ou ictéricas.

Armazenamento e estabilidade

- O plasma e o soro conservados 4 dias a temperatura ambiente, 7 dias a 2-8 °C e vários meses a -20 °C.
- As urinas acidificadas mantêm-se estáveis durante 6 meses.

VALORES DE REFERÊNCIAS (1,4)

Soro, plasma :	2,5 - 4,5 mg/dL
	0,81 - 1,45 mmol/L
Urina:	0,4 - 1,3 g/24 h
	12,9 - 42,0 mmol/24 h
	26,7 - 86,7 mg/dL*
	8,6 - 28,0 mmol/L*

* para um volume urinário de 1,5 l por 24 horas

Observação: Recomenda-se que cada laboratório estableça e mantenha os seus próprios valores de referência para a população desejada. Os valores anteriores são apenas fornecidos a título indicativo

PROCEDIMENTO
Procedimento manual

Comprimento de onda : 340 nm
Percurso óptico : 1 cm
Relação amostra/reagente : 1:100
Temperatura: 37 °C
Ler comparando com o branco de reagente

	CALIBRAÇÃO	DOSAGEM
Reagente R	1 000 µL	1 000 µL
Padrão	10 µL	-
Amostra	-	10 µL

Misturar e ler as absorbâncias (A) após 5 minutos.

Procedimento automático

Estes reagentes podem ser utilizados em vários analisadores automáticos. Para os analisadores ELITech Selectra, as aplicações validadas estão disponíveis mediante solicitação. Com o Selectra TouchPro, utilize a aplicação incluída no código de barras disponível no final deste folheto

CÁLCULO

a) Amostra x_n n = concentração do padrão
A Padrão

Para a dosagem do fósforo nas urinas, ter em conta o fator de diluição.

Fator de conversão: mg/dL x 0,3229 = mmol/L

CALIBRAÇÃO
Padrão Phosphorus é rastreável para o Norma de Referência de Material NIST SRM 3139a.

Frequência de calibração : A frequência de calibração é específica para cada equipamento (consultar § DESEMPENHO).

CONTROLE DE QUALIDADE

Para verificar a exatidão dos resultados, os soros controle, tal como ELITROL I e ELITROL II devem ser usados. Esses controles devem ser realizados e validados antes das amostras dos pacientes serem testadas. A frequência do controle deve ser efetuada, pelo menos, uma vez por dia, após cada calibração e deve ser adaptada aos procedimentos de controlo de qualidade de cada laboratório e aos requisitos regulamentares. Os resultados devem estar dentro dos limites definidos. Se os valores se estiverem fora dos limites definidos, cada laboratório deve tomar as devidas medidas corretivas. Os controles de qualidade devem ser utilizados de acordo com os procedimentos habituais.

TRATAMENTO DOS RESÍDUOS

Todos os resíduos devem ser eliminados de acordo com as exigências locais de regulamentação local, estadual e federal.

*: Modificação par rapport à la version précédente/Modification from previous version/ Modificación con respecto a la versión anterior/Modificação relativamente à versão anterior

USAGE PRÉVU

ELITech Clinical Systems PHOSPHORUS é um reagente de diagnóstico *in vitro*, destinado ao dosage quantitativo do fosfato inorgânico nas amostras de soro, plasma e urina.

SIGNIFICATION CLINIQUE (1,4)

Parmi la totalité du phosphore contenu dans l'organisme, 80 à 85 % est retrouvé dans le squelette. Le reste est essentiellement présent sous forme de phosphate inorganique. Il existe habituellement une relation réciproque entre le calcium et le phosphate dans le sérum. Une augmentation de l'un des composants s'accompagne habituellement d'une diminution de l'autre. Une augmentation de phosphate sérique peut se produire dans les hypervitaminoses D, l'hypoparathyroïdie et l'insuffisance rénale. Une réduction des taux sériques de phosphate s'observe lors de carence en vitamine D, et dans le cas d'hyperparathyroïdie.

La mesure de la phosphaturie peut être proposée comme examen complémentaire à la phosphatémie. La phosphaturie peut être augmentée lors d'une hyperparathyroïdie ou de dommages au niveau du tubule rénal (Syndrome de Fanconi), ou diminuée dans les hypoparathyroïdiens.

Le domaine de mesure est de 2,0 à 20,0 mg/dL (0,65 à 6,46 mmol/L).

Les échantillons ayant des concentrations supérieures devront être dilués à 1/5 dans une solution de NaCl 9 g/L et redosés.

Cette procédure étend le domaine de mesure jusqu'à 1000,0 mg/dL (322,9 mmol/L).

Pour les utilisateurs du logiciel Selectra TouchPro, la fonction «diluer» réalise la dilution des échantillons automatiquement. Les résultats tiennent compte de la dilution.

- Ne pas utiliser d'autres échantillons.

Avertissements et précautions

- Selon les Bonnes Pratiques de Laboratoire, tout prélevement devrait être réalisé avant l'administration de médicaments.

- Séparer rapidement les érythrocytes après collecte.

- Ne pas utiliser d'échantillons visiblement troubles ou ictériques.

Stockage et stabilité

- Le plasma e o soro são estáveis 4 dias a temperatura ambiente, 7 dias a 2-8 °C e vários meses a -20 °C.

- As urinas acidificadas mantêm-se estáveis durante 6 meses.

Limites de Détection (LoD) et Limite de Quantification (LoQ)

Determinadas selon o protocolo CLSI EP17-A⁽⁶⁾:

a) Sérum/plasma

Sérum, Plasma : 2,5 - 4,5 mg/dL

0,81 - 1,45 mmol/L

Urino : 0,4 - 1,3 g/24 h

12,9 - 42,0 mmol/24 h

26,7 - 86,7 mg/dL*

8,6 - 28,0 mmol/L*

* para um volume urinário de 1,5 l por 24 horas

b) Urine

Le domaine de mesure est de 10,0 à 200,0 mg/dL (3,2 a 6,46 mmol/L).

Les échantillons ayant des concentrations supérieures devront être dilués à 1/5 dans une solution de NaCl 9 g/L et redosés.

Cette procédure étende le domaine de mesure jusqu'à 1000,0 mg/dL (322,9 mmol/L).

Pour les utilisateurs do logiciel Selectra TouchPro, la fonction «diluer» réalise a diluição das amostras.

Les resultados tiennent compte da diluição.

Valeurs de Référence (1,4)

Determinadas selon o protocolo CLSI EP17-A⁽⁶⁾:

a) Sérum/plasma

Sérum, Plasma : 2,5 - 4,5 mg/dL

0,81 - 1,45 mmol/L

Urino : 0,4 - 1,3 g/24 h

12,9 - 42,0 mmol/24 h

26,7 - 86,7 mg/dL*

8,6 - 28,0 mmol/L*

* para um volume urinário de 1,5 l por 24 horas

b) Urine

Le domaine de mesure est de 10,0 à 200,0 mg/dL (3,2 a 6,46 mmol/L).

Les échantillons ayant des concentrations supérieures devront être dilués à 1/5 dans une solution de NaCl 9 g/L et redosés.

Cette procédure étende le domaine de mesure jusqu'à 1000,0 mg/dL (322,9 mmol/L).

Pour les utilisateurs do logiciel Selectra TouchPro, a função «diluar» realiza a diluição das amostras.

Os resultados tiennent compte da diluição.

Princípio (2)

Le fosfato inorgânico é medido usando a reação:

* para um volume urinário de 1,5 l por 24 horas

Remarque : Il est recommandé à chaque laboratoire d'établir et de maintenir ses propres valeurs de référence par rapport à la population visée. Les valeurs ci-dessus ne sont données qu'à titre indicatif.

Composition

Réactif : R

Acide sulfurique 210 mmol/L

Molybdate d'ammonium 650 µmol/L

Standard: Std

Phosphore 5 mg/dL

1,61 mmol/L

Procédure

Procédure manuelle

Longueur d'onde : 340 nm

Trajet optique : 1 cm

Ratio échantillon/réactif : 1:100

Température: 37 °C

Lire contre le blanc réactif.

Matériaux Requis Mais Non Fournis

- CONT-0060 ELITROL I

- CONT-0160 ELITROL II

- Solução salina normal (NaCl 9 g/L).

- Equipamento geral de laboratório.

- Ne pas utiliser de matériel ne figurant pas ci-dessus.

AVERTISSEMENTS ET PRÉCAUTIONS

- Ces dispositifs (réactif et standard) de diagnostic *in vitro* sont unicamente destinés aux professionnels.

- Le réactif R est classé comme dangereux :

ATTENTION : Provoque une irritation cutanée. Provoque une sévère irritation des yeux. Porter des gants de protection / un équipement de protection des yeux/visage.

EN CAS DE CONTACT AVEC LES YEUX: rincer avec précaution à l'eau pendant plusieurs minutes. Enlever les lentilles de contact si la victime en porte et si elles peuvent être facilement enlevées. Continuer à rincer. Si l'irritation oculaire persiste: consulter un médecin.

YEUX: rincer avec précaution à l'eau pendant plusieurs minutes. Enlever les lentilles de contact si la victime en porte et si elles peuvent être facilement enlevées. Continuer à rincer. Si l'irritation oculaire persiste: consulter un médecin.

Pour le dosage do fosfato dans as urines tenir compte do factor de diluição.

PHOSPHORUS

Références/References/ Composition du coffret/ Kit composition/
Referencias/ Referencias: Composición del kit/ Conteúdo da embalagem :
PHOS-0600 R 2 x 125 mL + Std 1 x 5 mL

PRINCIPLE ⁽²⁾

Determination of inorganic phosphorus is made according to the following reaction:

COMPOSITION

Reagent: R	Sulfuric acid	210 mmol/L
	Ammonium molybdate	650 μmol/L
Standard: Std		
Phosphorus		5 mg/dL 1.61 mmol/L

MATERIALS REQUIRED BUT NOT PROVIDED

- CONT-0060 ELITROL I
- CONT-0160 ELITROL II
- Normal saline solution (NaCl 9 g/L).
- General Laboratory equipment.
- Do not use materials that are not required as indicated above.

WARNINGS AND PRECAUTIONS

- These *in vitro* diagnostic devices (reagent and standard) are for professional use only.
- The reagent R is classified as hazardous :

WARNING : Causes skin irritation. Causes serious eye irritation. Wear protective gloves/eye protection/face protection. IF IN EYES : Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice/attention.

- For more information, refer to the Safety Data Sheet (SDS).
- The standard should be immediately and tightly capped to prevent contamination and evaporation.
- Take normal precautions and adhere to good laboratory practice.
- Use clean or single use laboratory equipment only to avoid contamination.

STABILITIES

Store at 2-25 °C and protect from light. Do not freeze. Do not use after expiration dates indicated on the vial labels.

On board stability :

The on-board stability is specific for each analyzer. (Refer to § PERFORMANCE DATA).

PREPARATION

The reagent and standard are ready to use.

PRODUCT DETERIORATION

- The product should be clear. Cloudiness would indicate deterioration.
- Do not use the product if there is visible evidence of biological, chemical or physical deterioration.
- Do not use the product if the damages of packaging might have an effect on the product performances (leakages, pierced vial).

SAMPLES ^(1,4)

Specimen

- Serum free of hemolysis from fasting patient.
- Lithium heparinized plasma free of hemolysis from fasting patient.
- Urine to acidify (pH<3) after collection and to dilute at 1/10 with saline solution NaCl 9 g/L before analysis (when there is no predilution by the analyzer). For users with Selectra Touch Pro software, Pre-dilution is performed automatically. Results take the dilution into account.
- Do not use other specimens.

Warnings and precautions

- According to Good Laboratory Practice, sampling should be performed prior to the administration of drugs.
- Separate from erythrocytes promptly after collection.
- Do not use visibly turbid or icteric samples.

Storage

- Plasma and serum are stable 4 days at room temperature, 7 days at 2-8 °C, and several months at -20 °C. - Acidified urines are stable for 6 months.

REFERENCE VALUES ^(1,4)

Serum, Plasma : 2.5 - 4.5 mg/dL
0.81 - 1.45 mmol/L

Urine: 0.4 - 1.3 g/24 h
12.9 - 42.0 mmol/24 h
26.7 - 86.7 mg/dL
8.6 - 28.0 mmol/L*

* for an urinary volume of 1.5 L per 24 hours

Note : The quoted range should serve as a guide only. It is recommended that each laboratory verifies this range or establishes a reference interval for the intended population.

PROCEDURE

Manual Procedure

Wavelength : 340 nm
Optical path : 1 cm
Sample/reagent ratio : 1:100
Temperature: 37 °C
Read against reagent blank.

TEST

Reagent R	CALIBRATION	TEST
1 000 μL	1 000 μL	
Standard	10 μL	-
Sample	-	10 μL

Mix and read the absorbances (A) after an incubation of 5 minutes.

Automatic Procedure

These reagents may be used in several automatic analyzers. For ELITech Selectra Analyzers, validated applications are available on request. For Selectra TouchPro software, use the application included in the barcode available at the end of this insert.

CALCULATION

(A) Sample

$$x n \quad n = \text{standard concentration}$$

Take dilution factor into account for the calculation of phosphorus concentration in urine.

Conversion factor : mg/dL x 0.3229 = mmol/L

CALIBRATION

Phosphorus standard is traceable to the Standard Reference Material NIST SRM 3139a.

Calibration frequency : The calibration is specific for each analyzer. (Refer to § PERFORMANCE DATA).

QUALITY CONTROL

To check the accuracy of assays, control sera such as ELITROL I and ELITROL II should be used. These controls must be performed and validated before the patient samples are assayed. The control frequency must be at least once a day, after each calibration and should be adapted to Quality Control procedures of each laboratory and the regulatory requirements. Results should be within the defined ranges. If values fall outside of the defined ranges, each laboratory should take corrective measures. Quality control materials should be used in accordance with local guidelines.

a) Serum/Plasma

A comparative study has been performed between an ELITech Clinical Systems Selectra ProM Analyzer and another FDA-approved system equipment (molybdate-UV method) on 100 human sera samples according to CLSI EP9-A2 protocol⁽⁸⁾.

The values were between 10.2 and 182.3 mg/dL (3.3 and 5.9 mmol/L).

The parameters of the linear regressions are as follows:

Correlation coefficient : (r) = 0.999

Linear regression: $y = 1.004 x + 0.05 \text{ mg/dL}$

(0.02 mmol/L)

b) Urine

A comparative study has been performed between an ELITech Clinical Systems Selectra ProM Analyzer and another FDA-approved system equipment (molybdate-UV method) on 52 urine samples according to CLSI EP9-A2 protocol⁽⁸⁾.

The values were between 2.01 and 18.82 mg/dL (0.65 and 0.88 mmol/L).

The parameters of the linear regressions are as follows:

Correlation coefficient: (r) = 0.999

Linear regression: $y = 0.883 x - 0.3 \text{ mg/dL}$

(0.1 mmol/L)

c) Limitations/Interferences

- Do not report results outside of the usable range.

d) Serum, plasma

Studies have been performed to determine the level of interference from different compounds according to CLSI EP7-A2 protocol⁽⁹⁾ and SFBC recommendations⁽¹⁰⁾. Recovery is within ±10% of initial value at phosphorus concentration of 2.17 mg/dL and 4.65 mg/dL.

Unconjugated bilirubin: No significant interference up to 15 mg/dL (257 μmol/L).

Conjugated bilirubin: No significant interference up to 3.0 mg/dL (50 μmol/L).

Glucose: No significant interference up to 528 mg/dL (29.31 mmol/L).

The measuring range is from 2.0 to 20.0 mg/dL (0.65 to 6.46 mmol/L).

Triglycerides: No significant interference up to 729 mg/dL (8.24 mmol/L).

Turbidity: Interference occurs at all levels of Intralipid®.

Hemoglobin: No significant interference up to 50 mg/dL.

Ascorbic acid: No significant interference up to 20.0 mg/dL.

Methyl-Dopa: No significant interference up to 1000.0 mg/dL (322.9 mmol/L).

For Selectra TouchPro users, the "dilute" function performs the sample dilution automatically. Results take the dilution into account.

e) Limit of Detection (LoD) and Limit of Quantification (LoQ)

Determined according to CLSI EP17-A protocol⁽⁶⁾.

f) Serum/Plasma

LoD = 0.12 mg/dL (0.04 mmol/L)

LoQ = 1.00 mg/dL (0.32 mmol/L)

g) Urine

LoD = 0.2 mg/dL (0.1 mmol/L)

LoQ = 10.0 mg/dL (3.2 mmol/L)

h) Precision

Determined according to CLSI EP5-A2 protocol⁽⁷⁾.

i) Serum, plasma

Studies have been performed to determine the level of interference from different compounds according to CLSI EP7-A2 protocol⁽⁹⁾. Recovery is within ±10% of initial value at phosphorus concentration of 25 mg/dL and 150 mg/dL.

Conjugated bilirubin: No significant interference up to 22.1 mg/dL (378 μmol/L).

Hemoglobin: No significant interference up to 500 mg/dL.

Uric acid: No significant interference up to 120 mg/dL (38.7 mmol/L).

* for an urinary volume of 1.5 L per 24 hours

Note : The quoted range should serve as a guide only. It is recommended that each laboratory verifies this range or establishes a reference interval for the intended population.

a) Serum/Plasma

Manual Procedure

Wavelength : 340 nm
Optical path : 1 cm
Sample/reagent ratio : 1:100
Temperature: 37 °C
Read against reagent blank.

TEST

n	Mean	Within-run	Total
	mg/dL	mmol/L	CV (%)
Low level	80	2.39	0.77
Medium level	80	4.77	1.54
High level	80	9.02	2.91

Urea : No significant interference up to 6000 mg/dL (999 mmol/L).

Ascorbic acid: No significant interference up to 20 mg/dL.

- Many other substances and drugs may interfere. Some of them are listed in reviews published by Young.⁽¹²⁻¹³⁾

- The results of this assay should only be interpreted in conjunction with other diagnostic test results, clinical findings and the patient's medical history.

b) Urine

Manual Procedure

Wavelength : 340 nm
Optical path : 1 cm
Sample/reagent ratio : 1:100
Temperature: 37 °C
Read against reagent blank.

TEST

n	Mean	Within-run	Total
	mg/dL	mmol/L	CV (%)
Low level	80	25.2	8,1
Medium level	80	72.5	23.4
High level	80	144.2	46.6

Urea : No significant interference up to 528 mg/dL (29.31 mmol/L).
